

What is Python?

Created by Guido van Rossum · Released 1991

Python is a high-level, interpreted, general-purpose programming language known for its clean syntax and readability — designed so that code reads almost like plain English.

Simple Syntax

Easy to read, write and learn

Open Source

Free to use, massive community

Interpreted

Run code line-by-line instantly

Rich Libraries

Thousands of ready-to-use packages

Cross-Platform

Runs on Windows, Mac & Linux

Versatile

Web, Data, AI, Automation & more

Why Python for AI?

The language of choice for Data Science, Machine Learning & Deep Learning

#1

Most Popular
Language (IEEE 2024)

70%+

AI/ML projects
use Python

300K+

Libraries &
packages available

15M+

Python developers
worldwide

01

Massive AI Ecosystem

NumPy, Pandas, Scikit-learn, TensorFlow, PyTorch, Keras — all Python-first.

02

Rapid Prototyping

Write and test AI models quickly. Less code, faster results than Java or C++.

03

Community & Support

Millions of developers, tutorials, forums, Stack Overflow answers at your fingertips.

04

Industry Adoption

Google, Meta, Netflix, NASA, Tesla all use Python for their AI systems.

05

Readable & Teachable

Clean syntax lowers the barrier — focus on AI logic, not language complexity.

06

End-to-End Capability

Data collection → preprocessing → modeling → deployment, all in one language.
