

The AI Family — How They Relate

Every inner field is a specialised subset of the one containing it

Artificial Intelligence

The broadest field — any system that simulates human-like reasoning, decision-making, or perception.

Machine Learning

A subset of AI where algorithms learn patterns from data and improve performance automatically over time.

Deep Learning

A subset of ML using artificial neural networks with many layers to model complex patterns in data.

Generative AI

DL models trained to generate new content — text, images, audio, video — that mimic real human output.

Agentic AI

AI systems that autonomously plan, decide, and act across multi-step tasks with minimal human oversight.
